Release notes.

Version 1.7.1

With the release of Araneo v1.7.1 Luminex brings support for new hardware devices, new features, and bug fixes.

New Features

- Images of Gigacore and LumiNode devices have been added to the locate window for easier and intuitive identification when looking for specific devices in the network.

- Support for the new LumiCore versions, LumiCore 64, LumiCore 32 and LumiCore16 has been added.

- Support for the new versions of GigaCore has been added. GigaCore 10i and 16i are now fully supported in Araneo.

- Support for the new GigaCore 10t has been added in the project mode. Which allows for planning of networks where these versions are to be used.

Bug Fixes

- Unknown flooding is now enabled (and can't be disabled) automatically when IGMP snooping has been disabled. This is bringing Araneo's behaviour now in line with the Gigacore WebUI.
